

Pos-A-Trac

- Maintains arena moisture content for a longer period of time
- Increases footing consistency by creating better moisture control
- Retained water content offers a lower dust factor
- Positive water drainage capabilities
- Creates a slight sponginess with less compaction between maintenance programs
- Provides a safer riding surface by reducing joint stress
- An excellent additive choice for multiple disciplines from Dressage to Driving
- Blends well with ground tire rubber to achieve the Airfoot / Lightfoot tennis shoe style of blends
- Fiber strength provides additional stability with a recorded life span of 8-10 years
- Pos-A-Trac-U.S is an environmentally friendly shredded material
- Prolongs the life of sand particles by providing a cushioning effect
- Installs and harrows without average complications
- Average installation ratio consist of 1/4lb per square foot per 2 inches depth
- Packaged in approximate 2,000 lb bales at a 42x48x78 size
- Bale coverage is approximately 8,000 square feet

There are several geo-textile grinds on the market that are marketed under several different names, some are ground in Europe some are ground here in the USA. They all perform close to the same by creating better moisture control which will ultimately result in better consistency.

We feel that our grind will create a more consistent footing with less product, hence, reducing your cost. With clear communication, Pos-A-Trac can be properly applied to meet your individual arena needs. By understanding your style of riding, watering capability, how many horses have access to the ring and how often, remaining life and size of the existing footing materials, your residing seasonal weather conditions, and whether you ride on an indoor or outdoor ring, we will be able to provide you with the best possible additive program for your horse and your arena. *John and Barb Dienhart*
